

RADIATION RESEARCH IN ONCOLOGY

HIRO and OncoRay Lecture Series 2017/18 & 2018/19

OBJECTIVES OF THE LECTURE SERIES

Radiation research and radiotherapy in oncology are highly interdisciplinary fields: physicians, scientists like biologists and physicists as well as engineers and computer experts are closely collaborating within the Heidelberg Institute of Radiation Oncology (HIRO) and OncoRay in Dresden.

The established cooperation of HIRO and OncoRay was awarded by BMBF as the National Center for Radiation Research in Oncology (NCRO).

To train young scientists in interdisciplinary research work is a special responsibility of HIRO, DKFZ and OncoRay. An important condition for a fruitful scientific collaboration is an active communication between researchers and consequently a common knowledge of the fundamentals of the whole field. This will be supported by this series of 18 lectures in 2 years.

The lectures cover a wide spectrum of topics from medicine, biology, chemistry, physics and technology being relevant for the research at HIRO Heidelberg and OncoRay Dresden. Each lecture will give a commonly understandable overview on a particular topic.

Therefore, all PhD students of the DKFZ, the Heidelberg university hospital and OncoRay as well as collaborating institutions and all other interested persons are cordially invited to join the lectures!

TOPICS AND DATES

1. Radiation and its generation (Prof. Dr. Oliver Jäkel)

Thursday, 12.10.2017, 5 – 6.30pm, Big Seminar Room, ATV Building (A0.106), ground floor

Radiation is the fundamental basis of radiation research and radiation application in oncology. This lecture provides an introduction to different types of radiation used in radiation oncology like Co-60 sources, neutrons, Megavoltage X-rays and heavy charged particles like protons and ions. Some of the principles of generation of radiation will be explained, like the electron linear accelerators and particle accelerators. The lecture will also highlight some historic and future developments.

2. Interaction of radiation with matter (Prof. Dr. Wolfgang Enghardt)

Thursday, 23.11.2017, 5 – 6.30pm, Lecture Hall H1

Each diagnostic or therapeutic application of ionizing radiation exploits physical effects which occur during the interaction between radiation and matter. In this lecture, an overview on those mechanisms of interaction between ionizing radiation (photons, electrons, ions, neutrons) and matter, which are relevant for medical applications, will be given.

3. Fundamentals of oncology (Prof. Dr. Dr. Jürgen Debus)

Thursday, 14.12.2017, 5 – 6.30pm, Lecture Hall H1

This lecture gives an introduction on the importance of cancer and the main treatment methods. Risk factors, curative and palliative treatment options and the increasing role of interdisciplinary oncology are discussed.

4. Clinical radiation oncology (Prof. Dr. Mechthild Krause)

Thursday, 08.02.2018, 5 – 6.30pm, Seminar Room H2.05.068, Main Building, 05th floor

Understanding of tumor radiation biology is a basis for effective clinical application of radiotherapy. This lecture gives an overview on the clinical importance of radiobiological factors and on their integration into clinical radiotherapy protocols.

5. Molecular and cellular radiobiology (Prof. Dr. Nils Cordes)

Thursday, 01.03.2018, 5 – 6.30pm, Big Seminar Room, ATV Building (A0.106), ground floor

Exposure to ionizing radiation induces myriads of molecular and biological reactions in a cell. Fundamental concepts of cellular radiobiology including modes of cell death, proliferation and cellular targets will be introduced. While some reactions differ between normal and tumor cells, the majority shows to function in a uniform manner. Particularly, mechanisms that govern cell survival, proliferation and DNA repair will be reviewed and discussed within the context of testing novel therapeutic approaches against cancer.

6. Technology of Radiotherapy (Prof. Dr. Oliver Jäkel)

Thursday, 22.03.2018, 5 – 6.30pm, Big Seminar Room, ATV Building (A0.106), ground floor

The lecture reviews the state-of-the-art technology for radiotherapy. This includes: linear electron accelerators, novel robotic and tomographic methods of dose delivery, proton and ion accelerators. Furthermore, new sophisticated techniques like image guidance and motion compensation will be introduced.

7. Biomarkers in Radiotherapy (Dr. Dr. Amir Abdollahi)

Thursday, 26.04.2018, 5 – 6.30pm, Big Seminar Room, ATV Building (A0.106), ground floor

The identification and definition of molecular prognosticators and predictors for radiotherapy is an important task in radiation oncology. How could they be employed to better diagnose cancer or to stratify patients most benefiting from high-precision or multimodal therapies? This lecture gives an overview on current developments and future perspectives of biologically individualized radiation oncology.

8. Industrial Application of Radiation (Prof. Dr. Uwe Hampel)

Thursday, 17.05.2018, 5 – 6.30pm, Big Seminar Room, ATV Building (A0.106), ground floor

Radiation based measurement and imaging techniques are not only used in medicine but also in industrial and non-medical research. Two prominent examples are non-destructive testing and flow measurement. The lecture reviews the use of ionizing radiation for industrial measurement problems and particularly flow measurement applications.

9. Tumor Pathophysiology (Prof. Dr. Leoni Kunz-Schughart)

Thursday, 28.06.2018, 5 – 6.30pm, Big Seminar Room, ATV Building (A0.106), ground floor

Growth and progression of solid tumors are accompanied by numerous physiological alterations as compared to normal tissues. In this lecture, an overview about the different aspects of tumor pathophysiology will be given and causes and consequences of tumor pathophysiological resistance factors in radiotherapy (e.g. chronic vs. acute hypoxia) will be discussed.

Summer Break 2018
